Ball screws

General informations

1.1 Basic range of ball screws

Manufacturing method	Accuracy class Max. path deviation v_{300p} over 300 mm	Diameter range	Lead range
Rolled	T 5 (0.023 / 300 mm) T 7 (0.052 / 300 mm)	8 - 63 mm	2.5 - 40 mm
Peeled	P 5 (0.023 / 300 mm) P 7 (0.052 / 300 mm)	16 - 80 mm	5 - 20 mm
Ground	P 1 (0.006 / 300 mm) P 3 (0.012 / 300 mm) P 5 (0.023 / 300 mm)	6 - 100 mm	1 - 50 mm

1.2 Procedure for the selection of a ballscrew

	Rolled	Peeled	Ground
Profile			
Manufacturing process	Forming process	Cutting process	Grinding process
Typical applications	Transportation	Transportation and positioning	Positioning
Nut shapes	Flange nut Cylindrical nut	Flange nut Cylindrical nut Double nut	Flange nut Cylindrical nut Double nut

1.3 Material and hardness of the ball screws

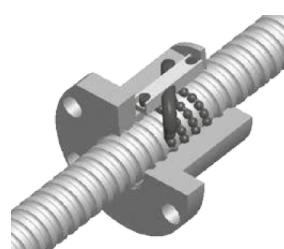

Type	W. Nr.	DIN	Hardness [HRC]
Spindle	1.1213	Cf 53	58 - 62
Nut	1.6523	21 NiCrMo 2	58 - 62
Ball	1.3505	100 Cr 6	62 - 66

1.4 Ball recirculation systems

HIWIN ballscrews are available with three different recirculation systems.

The external recirculation system comprises the ballscrew shaft, ballscrew nut, steel balls, ball recirculation system and clamping plate. The balls are placed in the ball track between the ballscrew shaft and nut. At the end of the nut, they are guided out of the ball track and back to the start via a return tube; ball circulation is therefore a closed circuit.

External recirculation type nut with return tubes

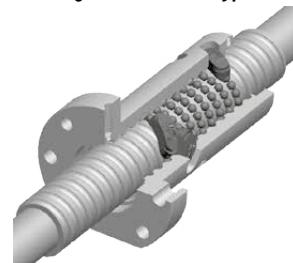

Ball screws

General informations

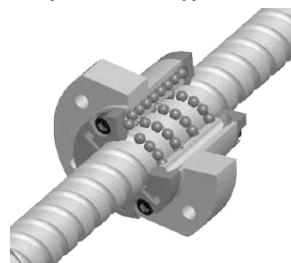

The internal single recirculation system comprises the ballscrew shaft, ballscrew nut, steel balls and deflecting parts. The balls undertake just one circuit around the shaft. The circuit is closed by a deflecting part in the ballscrew nut and allows the balls to return to the start via the rear of the thread. The position of the ball deflection in the nut gives the internal single recirculation system its name.

Internal single recirculation type nut with return caps

The third type of return is the endcap recirculation system. It has the same basic principle as the external return, however, the balls are returned via a channel in the ballscrew nut. The balls perform one complete cycle in the ballscrew nut. The endcap return or "internal total recirculation" provides good loading capacity with short track lengths and small nut diameters.

Endcap recirculation type nut with recirculation system

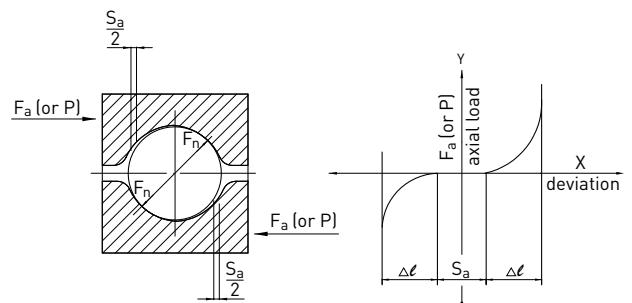

1.5 Preload and play

The Gothic arch profile permits a ball contact angle of 45°. The axial force F_a caused by outer drive forces or inner preload forces, produces two kinds of axial play. Firstly, axial play S_a , that originates from the air between the ball and ball track.

By default, rolled and peeled ballscrews are delivered with slight play. This is sufficient for most applications, and has the advantage that the ballscrews run smoothly and a low starting torque is required.

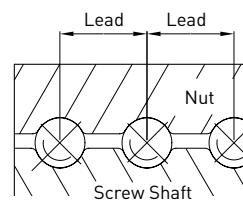

If increased demands are placed on the positioning accuracy and rigidity, the axial play can be neutralised by a preload force P . For this purpose, different methods are available.

Fig. 2.16 Gothic arch profile and preload

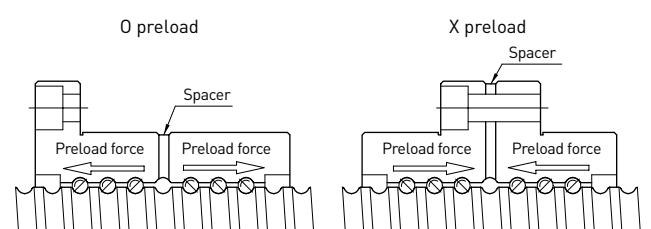

Preloaded single nuts

Preload method with oversized balls involves balls which are slightly larger than the space in the ball track; the ball therefore makes contact at four points.

Preloaded double nuts

The preload is generated by inserting a spacer between the nuts. The O preload results from fitting an oversized spacer which pushes the halves of the nut apart. The X preload is generated with an undersized spacer which pulls the nuts together.

Ball screws

Rolled

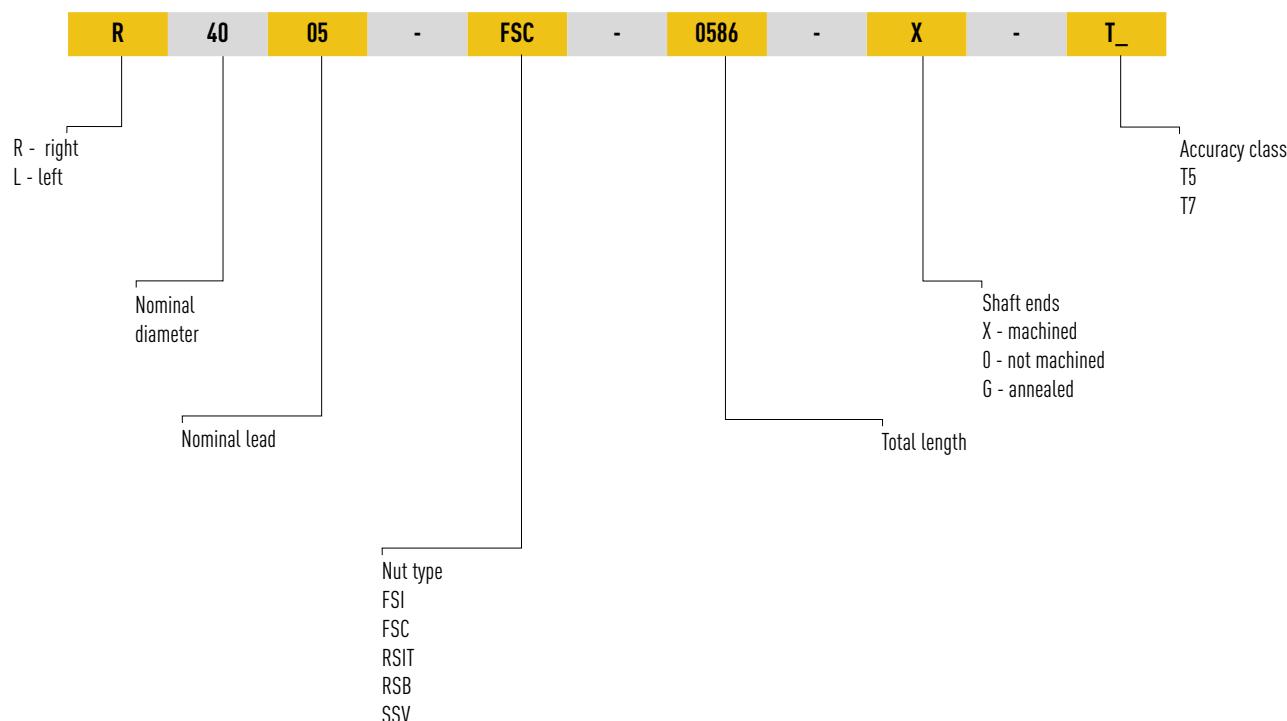

2.1 Properties of rolled ball screws

One of the benefits of rolled ballscrews is that feed systems equipped with them have less friction and are quieter than standard threads.

HIWIN manufactures them using state-of-the-art rolling technologies where the processes of material selection, rolling, heat treatment, machining and assembly are very closely coordinated. Rolled ballscrews from HIWIN can be flexibly used in virtually all areas of industry. Rolled ballscrew shafts with diameters of 8 mm to 63

mm are always kept in stock and can be supplied at short notice. They can be supplied with or without end machining. Complete bearing units combined with standardised shaft ends enable us to supply complete ballscrews.

2.2 Order code of rolled ball screws

Ball screws

Peeled

3.1 Properties of peeled ball screws

In terms of quality, peeled ballscrews from HIWIN fall between rolled and ground ballscrews and can therefore be used for numerous transport or positioning applications. On request, we are happy to produce a lead measurement report for them. A number of nut shapes are available for peeled ballscrews, as both single and double nuts. Customised complete ballscrews can be produced with short lead times. Complete bearing units combined with standardised shaft ends minimise the amount of design work involved.

3.2 Order code of peeled ball screws

Ball screws

Ball screws for special requirements

4.2 Safety nut SEM

The safety nut comprises a ball thread unit and safety unit. The safety nut basically works like a normal ballscrew nut. If the axial play is increased due to wear, ball failure or ball loss, the thread of the safety unit comes into contact with the ball thread. The nut cannot therefore break out. The normal function of the unit is guaranteed up to an axial play of 0.4 mm.

Areas of application:

- Lifting equipment
- Clamping fixtures
- Lifting platforms
- Elevators

Ball screws

Bearing housings

5.1 Fixed bearing housing type SFA

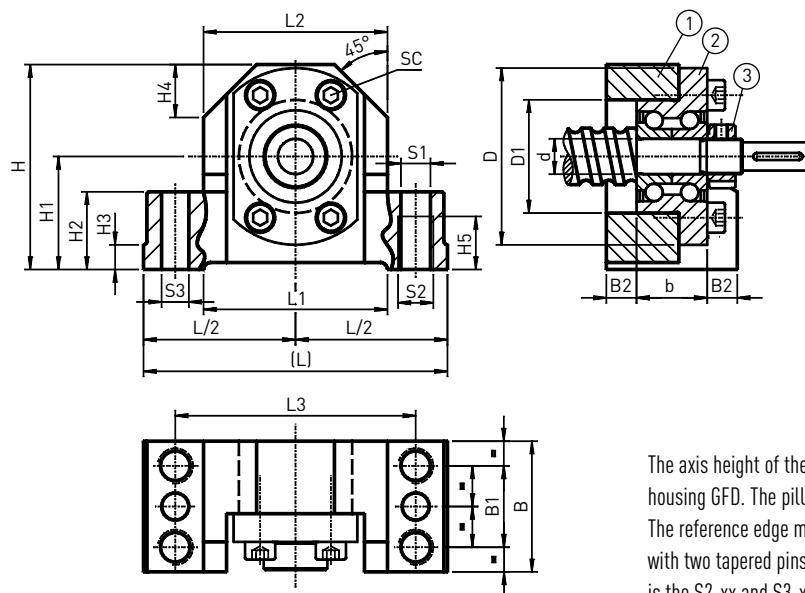

Precise bearing housings SFA are recommended for peeled and ground ball screws.

Fixed bearing housing SFA includes:

- Steel housing
- Angular contact ball bearing ZKLF
- Lock nut

SFA-06 ÷ SFA-10

The axis height of the fixed bearing is matched to supported bearing SLA and nut housing GFD. The pillow block can be screwed on from above (S1) and below (S2). The reference edge makes it easier to align the unit. The fixed bearing can be pinned with two tapered pins or cylindrical pins. The end machining suited to the fixed bearing is the S2-xx and S3-xx type.

Ball screws

Bearing housings

5.2 Simple bearing housing type SLA

Precise bearing housings SLA are recommended for peeled and ground ball screws.

Simple bearing housing SLA includes:

- Steel housing
- Radial bearing
- Circlip

(1) Steel housing, (2) Radial bearing, (3) Circlip

The axis height of the supported bearing is matched to fixed bearing SFA and nut housing GFD. The housing can be screwed on from above (S1) and below (S2). The reference edge makes it easier to align the unit. The end machining suited to the supported bearing is the S5-xx or S1-xx type.

5.9 WBK bearing housings for high load

Thanks to their robust steel bearing housing, the flange bearing units of the WBK series are especially suited to use in heavy-duty ballscrews. Depending on the axial loads present, the WBK bearing units are available with the DF, DFD and DFF bearing arrangements.

The end machining processes suited to the WBK fixed bearing are types WS2 and WS3.

High load bearing set WBK includes:

- Steel bearing housing
- Angular contact ball bearing (2, 3 or 4 pcs)
- Spacer (2 pcs)
- Lock nut

7.1 Nut housing GFD for flanged nuts acc. DIN69501 part 5

The nut housing is suitable for assembling flange nuts DEB, DDB and FSCDIN.

The axis height of the housing is matched to fixed bearing SFA and the supported bearing SLA.

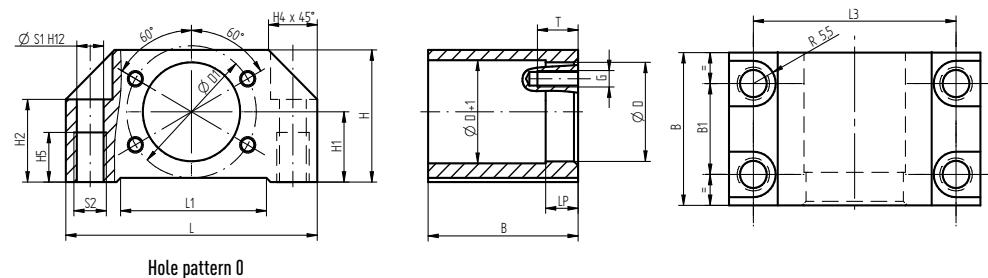

The housing can be screwed on from above (S1) and below (S2).

The housing GFD-16 ... 50 can be pinned with two tapered pins or cylindrical pins.

Screws of strength class 8.8 should be used for the fastening.

7.4 Spiral spring cover

Spiral Springs are manufactured specifically to suit horizontal or vertical operation. For horizontal applications, the extension is reduced (see tabulations).

SD - Maximum outside diameter of the part to be covered *value is reduced by 6 mm when using flanges

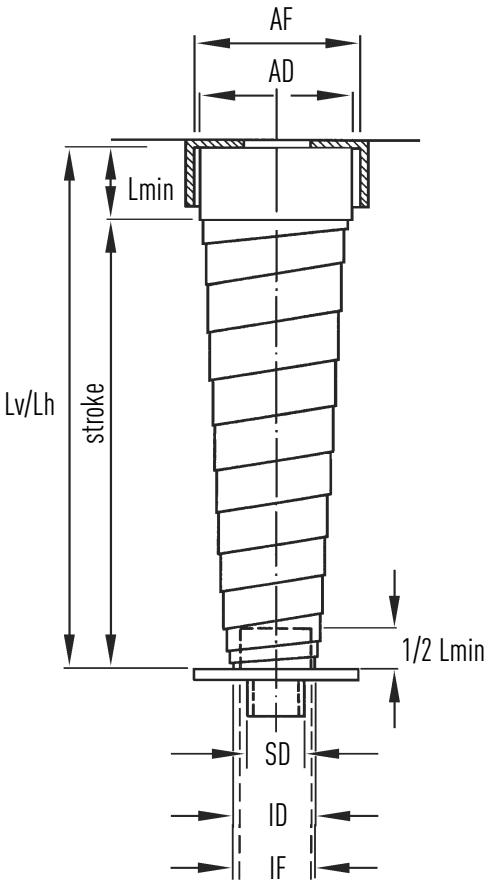

ID - Inside diameter of spiral spring (± 1 mm)

AD - Outside diameter of spiral spring (± 2 mm)

L_h - Maximum extension length for horizontal installation position

L_v - Maximum extension length for vertical installation position

BB - Band width, corresponds to L_{min}

Installation

- Before installing the coil spring ensure that the flanges on the machine have the tolerances specified in the catalogue.
- The coil spring must be installed in accordance with the mounting label H (horizontal) or V (vertical). When installed vertically the spring's larger mounting diameter is uppermost.
- The wires must not be removed until after the coil spring has been installed at its intended position and the flanges are about two to three coil strip widths apart.
- Remove all of the wiring.
- After removing the wiring insert the coil spring carefully into the flange receiver. Do not let the coil spring snap out!
- Note: When installed coil springs must move freely and must not be screwed or riveted!

Dimensions in [mm]

Yellow field - available also from Stainless Steel.

Ball screws

Accessories

7.5 Angular contact ball bearing ZKLFA

- Double-row angular contact ball bearing in O arrangement with 60° contact angle
- Outer ring suitable for flange mounting
- Split inner ring with defined gap for matching of preload
- Lubricated for life for most applications

The ball cages are made from plastic, permissible continuous operating temperature 120 °C.

- 1) Contact angle $\alpha = 60^\circ$.
- 2) min. $r_s = 0.3$ mm.
- 3) min. $r_{ls} = 0.6$ mm; min. $r_{is} = 0.3$ mm.
- 4) Minimum diameter required of installation surface.

If these diameters are not reached, D_1 and d_1 should be noted.

The ball cages are made from plastic, permissible operating temperature 120 °C (continuous operation).

1) Contact angle $\alpha = 60^\circ$.

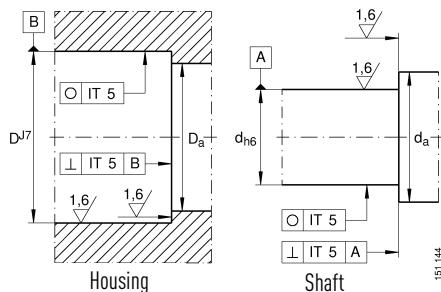

2) Minimum diameter required of installation surface.

.2Z = Gap seal

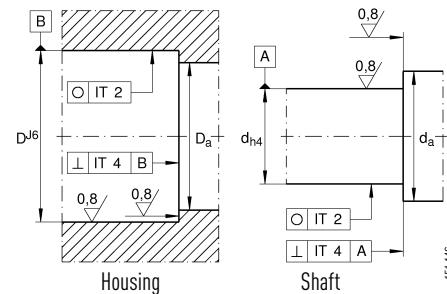

.2RS = Contact seal
